QUESTION (2.14)

A die is thrown twice and the sum of the numbers appearing is observed to be 6. What is the conditional probability that the number 4 has appeared at least once?.

SOLUTION(2.14):

Let A be the event that the sum of the numbers appearing is 6 when a die is thrown twice.
Let B be the event such that the number 4 appears atleast once in the two throws.
We need the conditional probability of event B given that A has occurred.

$$\Pr(B|A) = \frac{\Pr(AB)}{\Pr(A)} \tag{0.0.1}$$

Let $X_i \in \{1,2,3,4,5,6\}, i = 1,2.$ be a random variable representing the outcome for each die.
The probability that A occur is same as the probability that $X_1 + X_2 = 6$.
We have that,

$$\Pr(X_1 + X_2 = n) = \begin{cases} 0 & n \le 1 \\ \frac{n-1}{36} & 2 \le n \le 7 \\ \frac{13-n}{36} & 8 \le n \le 12 \\ 0 & n \ge 13 \end{cases} \tag{0.0.2}$$

Therefore using equation (0.0.2) we can write that,

$$\Pr(X_1 + X_2 = 6) = \frac{5}{13} \tag{0.0.3}$$

Therefore,

$$\Pr(A) = \frac{5}{13} \tag{0.0.4}$$

$\Pr(B)$=probability of getting a four atleast once
let X be a random variable which represents number of times 4 appears in two throws of a die.

$$\Rightarrow \Pr(B) = \Pr(X = 1) + \Pr(X = 2) \tag{0.0.5}$$

From binomial distribution we can write ,

$$\Pr(B) = \binom{2}{1}\left(\frac{1}{6}\right)\left(\frac{5}{6}\right) + \binom{2}{2}\left(\frac{1}{6}\right)^2 \tag{0.0.6}$$

$$= \frac{11}{36} \tag{0.0.7}$$

The event AB is such that the sum should be six with atleast one 4. Therefore the other number must be 2.
There are only two possible cases {4,2},{2,4} out of 36 possible cases.
Hence,

$$\Pr(AB) = \frac{2}{36}. \tag{0.0.8}$$

Substituting equations (0.0.4),(0.0.8) in (0.0.1) , we get

$$\Pr(B|A) = \frac{\frac{2}{36}}{\frac{5}{36}} = \frac{2}{5}. \tag{0.0.9}$$

Hence the probability of occurring atleast one 4 when the sum of the numbers is 6 when a die is thrown twice is $\frac{2}{5}$.
